

link SDK – additional example for Android

# **Write-To-Type**

---

# Architecture

# Configurations for Write-to-Type example

---

- Two instances of “**Recognizer**” are used for each of Text and Gesture recognition.
- Recognizer configuration
  - Common
    - Scale to convert input coordinates unit into mm must be configured like : `scaleX = 25.4f / screen_x_dpi`.
  - For Text recognition
    - Recognizer instance needs to be created with type name “**Text**” – `Engine.createRecognizer(scaleX, scaleY, "Text")`.
  - For Gesture recognition
    - Recognizer instance needs to be created with type name “**Gesture**” – `Engine.createRecognizer(scaleX, scaleY, "Gesture")`.
- “Commit” is handled by WriteToTypeWidget class (const COMMIT\_TIMEOUT)
  - Default commit timeout: 500ms
  - It can be configured by calling a method `WriteToTypeWidget.setCommitTimeout(timeout_in_millisecond)`.
- Language can be set through `WriteToTypeWidget.setLanguage(language_code)`.
  - Default language: en\_US
- By default, both of Pen (ActiveStylus) and Finger inputs are available.
  - By calling a method `WriteToTypeWidget.setActiveStylusOnly(true)`, Finger input can be disabled.

# Behaviors defined in *InputMethodEmulator* class (1/3)

---

- Auto focus changing
  - When something is written on an EditText which is not the active one, the focus is changed to the EditText.
- Text (*onText*)
  - **Text Input**: when a text is written on an empty area of an EditText, or out of active EditText, the text is inserted into the EditText.
  - **Scratch-Out (Erase)**: when a stroke is written over an existing digital text, it erases the existing text.
- Scratch Gesture (*onScratch*)
  - **Scratch-Out (Erase)**: when it is written over an existing digital text, it erases the existing text.
  - **Text Input**: when it doesn't overlap any existing digital text, the Text Recognition result is added to an active EditText.
- Surround Gesture (*onSurround*)
  - **Select Area**: when it is written over an existing digital text, it selects the existing text (partial-word selection available).
  - **Text Input**: when it doesn't overlap any existing digital text, the Text Recognition result is added to an active EditText.

# Behaviors defined in *InputMethodEmulator* class (2/3)

---

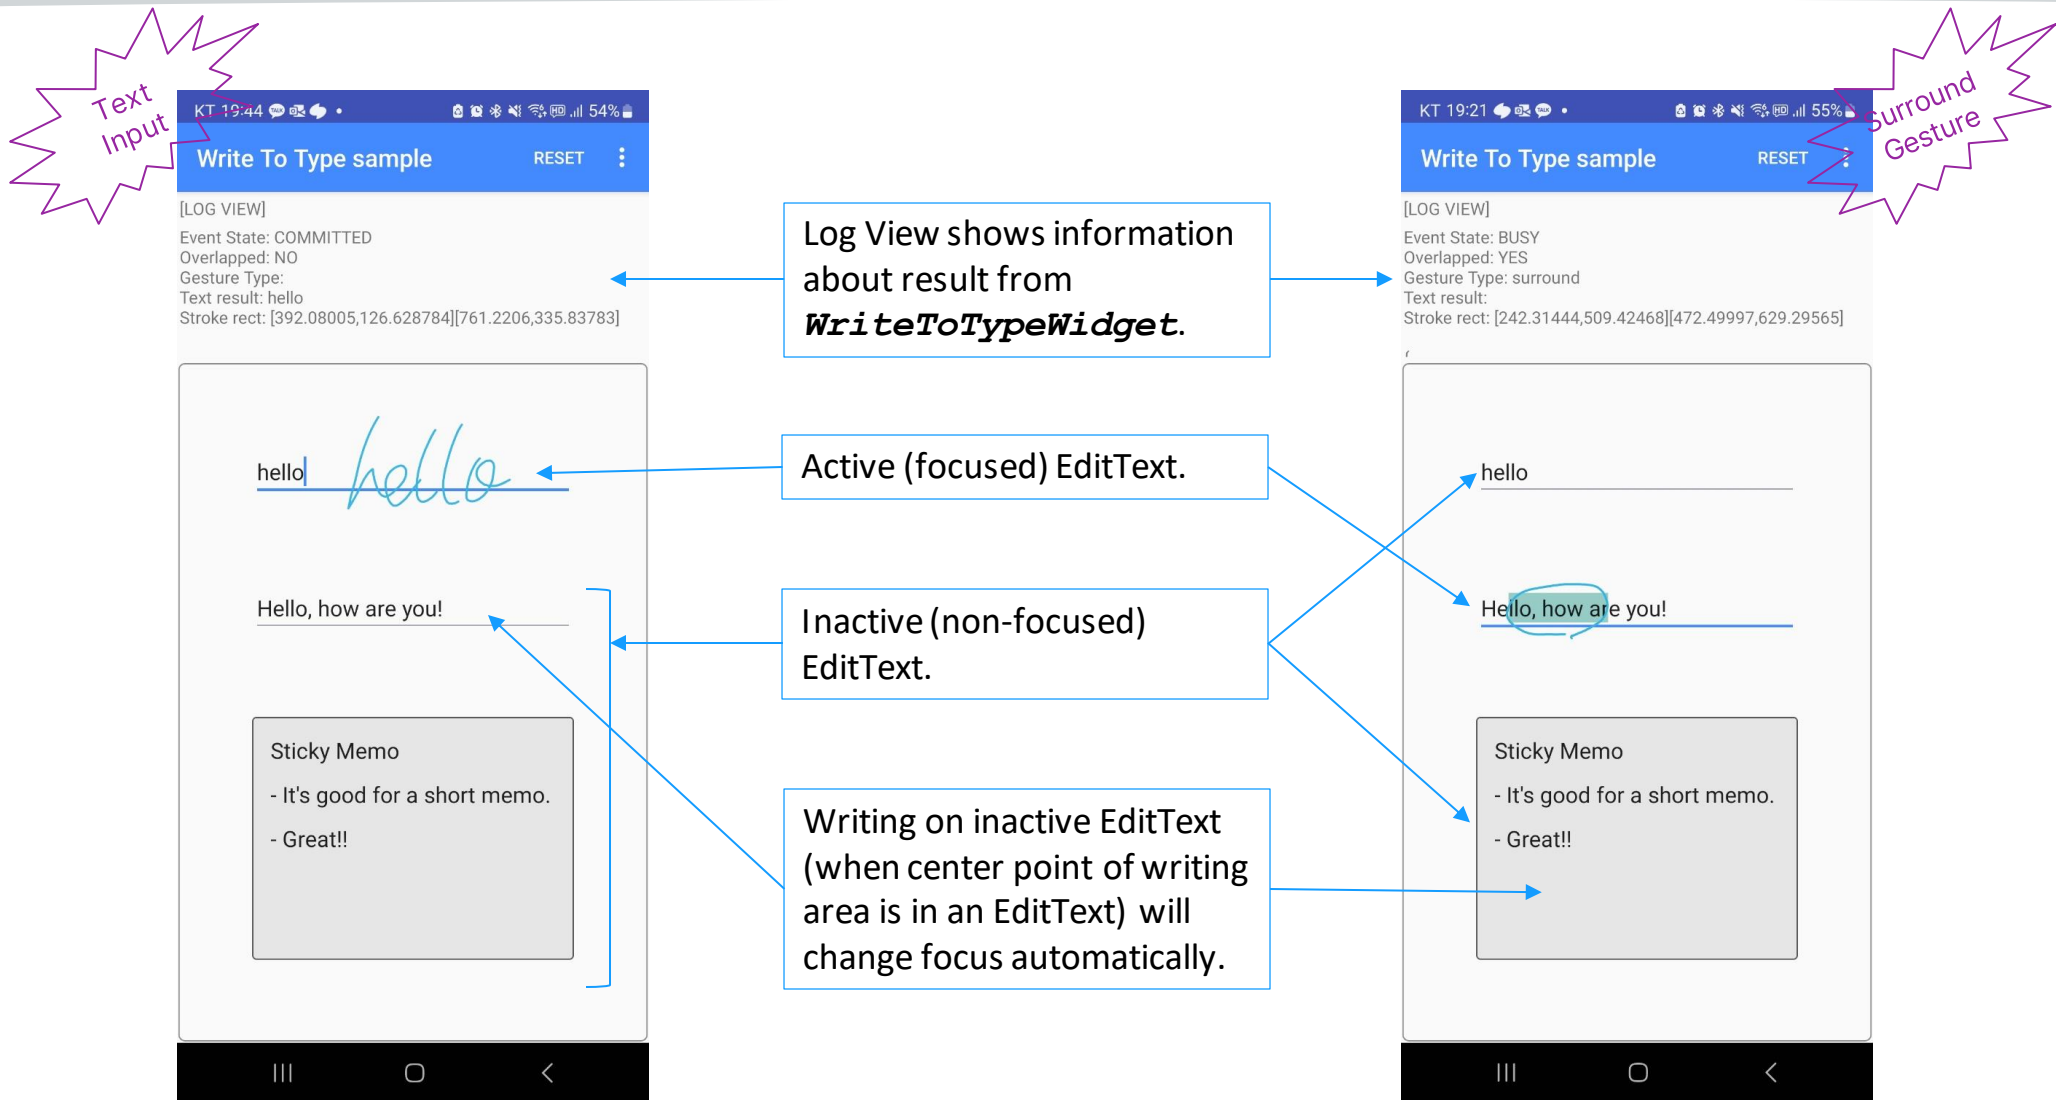

- Top to Bottom Gesture (*onTopBottom*)
  - **Add Space**: when it passes through an existing digital text, and there is no space near the line, it adds a space.
  - **Text Input**: when it doesn't pass through an existing digital text, a Text Recognition result ("|", "1", "l", ...) is set to a focused EditText.
- Bottom to Top Gesture (*onBottomTop*)
  - **Remove Space**: when it passes through an existing digital text, and there is a space near the line, it removes the space.
  - Otherwise, it is ignored.
- Left to Right Gesture (*onLeftRight*)
  - **Select Area**: when it is written over or bottom of an existing digital text, it selects characters of the stroke area.
  - **Forward Cursor**: when it doesn't overlap an existing digital text, it moves the cursor one letter forward.
- Right to Left Gesture (*onRightLeft*)
  - **Select Area**: when it is written over or bottom of an existing digital text, it selects characters of the stroke area.
  - **Backward Delete**: when it doesn't overlap an existing digital text, it deletes one character backward from current cursor.

# Behaviors defined in *InputMethodEmulator* class (3/3)

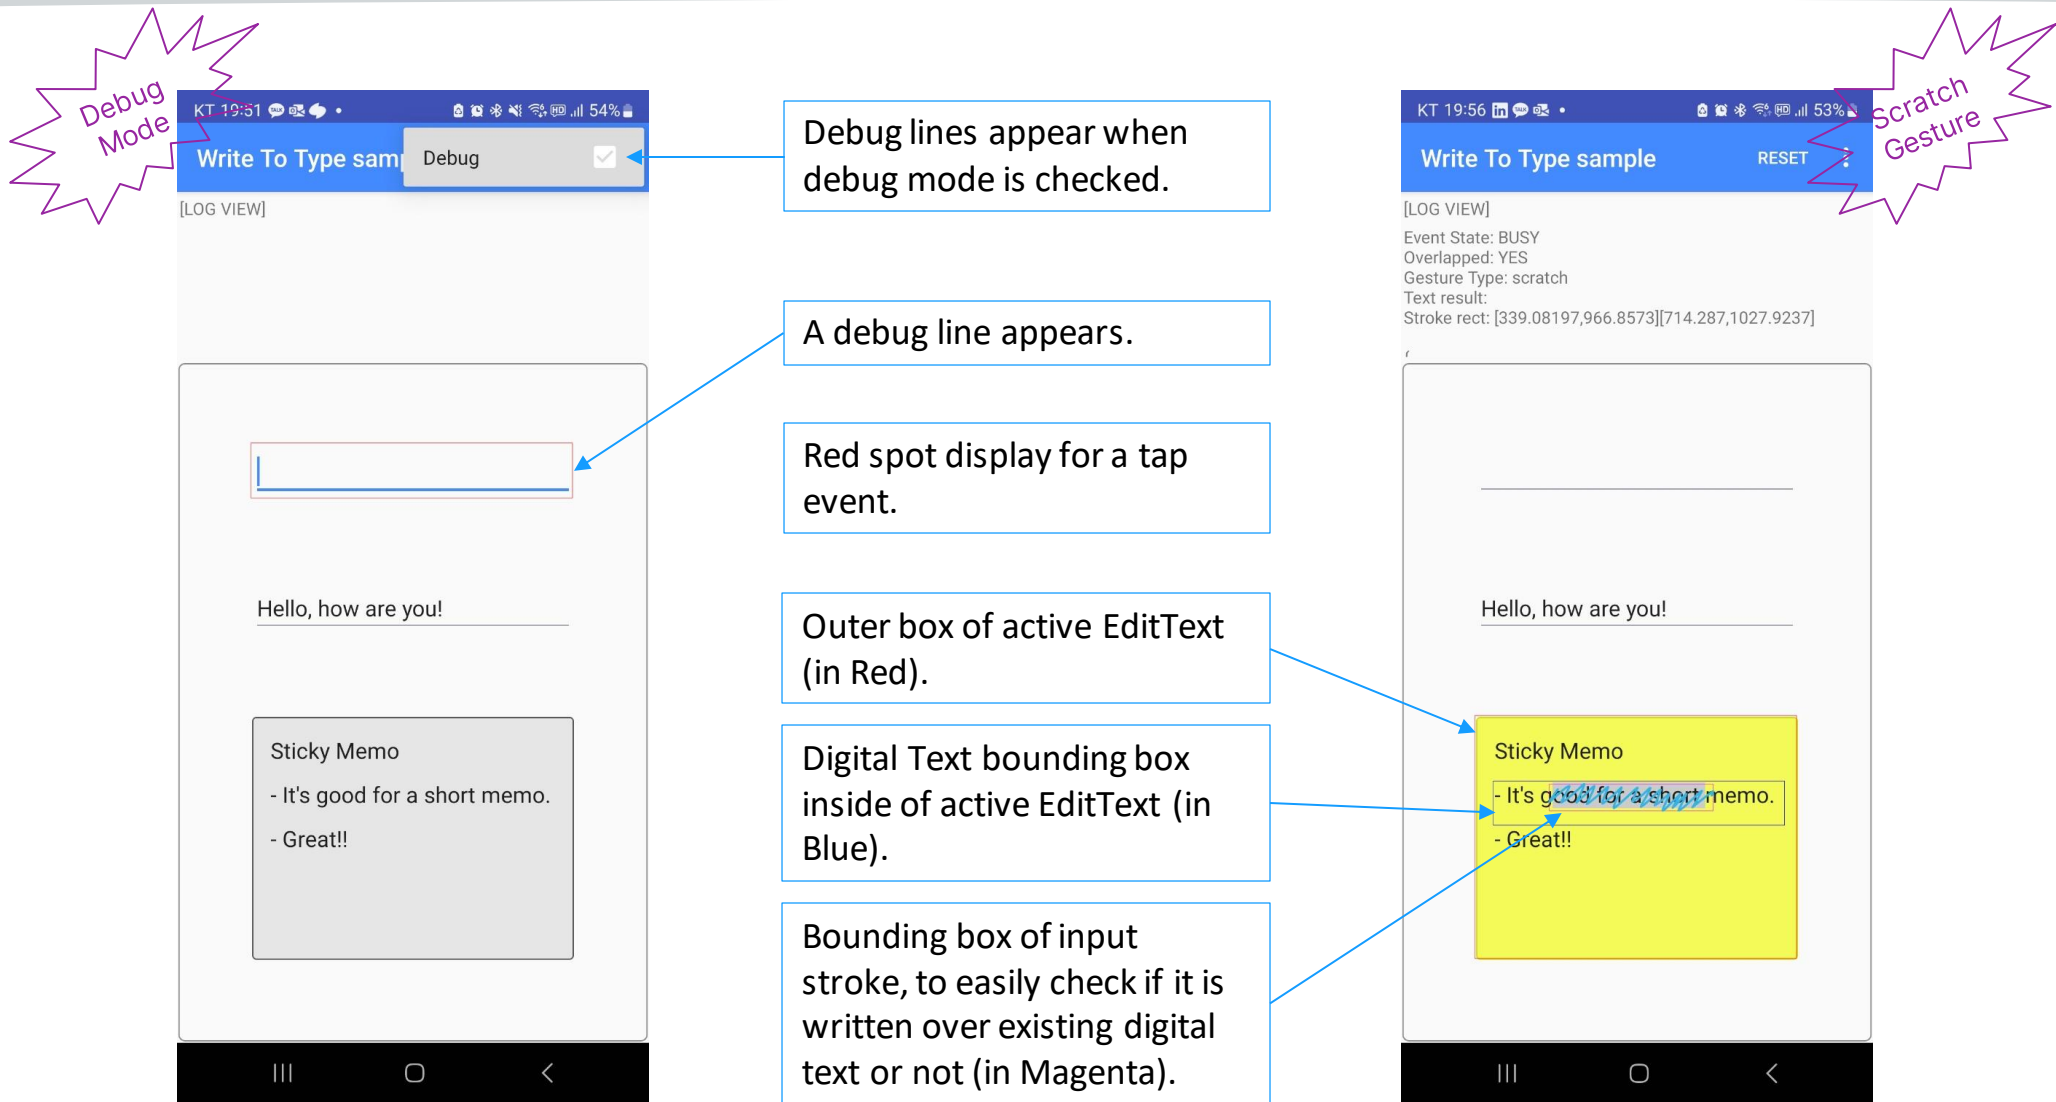

---

- Single Tap Gesture (*onSingleTap*)
  - On an EditText
    - Already active EditText (which means it already has the focus)
      - **Change Cursor Position**: when it happens over an existing digital text, it changes the cursor position to the tapped position.
      - **Text Input**: when it happens on empty area of the EditText, the Text Recognition result is inserted to current cursor position.
    - Non-activated EditText
      - **Change Focus**: when it happens over an empty area of the EditText, it changes the focus to the EditText.
  - Out of EditText
    - **Text Input**: when it happens out of an EditText, a Text Recognition result (".", ",", ...) is inserted to current cursor position of the focused EditText.
- Double Tap Gesture (*onDoubleTap*)
  - On an EditText
    - **Change Focus and Cursor Position**: when it happens on an existing digital text, it changes focus and select the word nearest the double tap.
  - When it happens out of EditText, it is just ignored.
- Long Press Gesture (*onLongPress*)
  - On an EditText
    - **Change Focus and Cursor Position**: when it happens on an existing digital text, it changes focus and selects the word nearest the long press.
  - When it happens out of EditText, it is just ignored.
